

## OLEA<sup>®</sup> LIB Algorithms and function software libraries

Rich collection of advanced software and automotive algorithms optimized for OLEA<sup>®</sup> FPCU, boosting application performance and enabling rapid time to market

- Configure and **customize** complex algorithms
- **Cutting edge** inverter, DC-DC converter and OBC control systems
- x40 computation **speed improvement** on advanced mathematical and computation functions
- Design and development **turnaround in minutes** with full integration into OLEA<sup>®</sup> COMPOSER

### Customize and boost your control system

**Boost performance:** Software and algorithms included into OLEA<sup>®</sup> LIB have been optimized for OLEA<sup>®</sup> FPCU and take all the benefits of the hardware resources and accelerators available (mathematical units, DSP functions and standard peripherals) to deliver the highest achievable performance and integration.

**Shorten development times :** By using OLEA<sup>®</sup> LIB , developers drastically reduce the time required to develop, optimize, test and calibrate their algorithm's on OLEA<sup>®</sup> FPCU.

OLEA<sup>®</sup> LIB is packaged into three complementary levels of integration selectable upon the application needs:

**OLEA<sup>®</sup> LIB System:** Efficient System Functions

**OLEA<sup>®</sup> LIB Algo:** Specialized and Enhanced Algorithms

**OLEA<sup>®</sup> LIB Math:** Accelerated Mathematical Functions

Libraries comes as building blocks available as Reference and Target Models for MATLAB<sup>®</sup> Simulink, or as HDL pre-defined blocks, and tuned for best use of OLEA<sup>®</sup> FPCU. Models out of OLEA<sup>®</sup> LIB are directly usable within OLEA<sup>®</sup> COMPOSER for MiL simulations and automatic code generation.

#### OLEA<sup>®</sup> LIB Math

- Coordinate Rotation Digital Computer
- Division operator
- Square Root operator
- Matrix Multiplier
- PID

#### OLEA<sup>®</sup> LIB Algo

- Clarke and Park current transform
- Decoupling and Flux Weakening
- Inverse Park / Clarke voltage
- Space Vector Modulation PWM
- ID/IQ Regulations
- Motor Speed Regulation
- Tracking loop position estimator (Magnetic Resistive, Resolver...)
- Sensorless position estimation (Start-up/ Low-speed /High speed)
- Buck-Boost DC/DC regulation

#### OLEA<sup>®</sup> LIB System

Inverter Control (FoC)

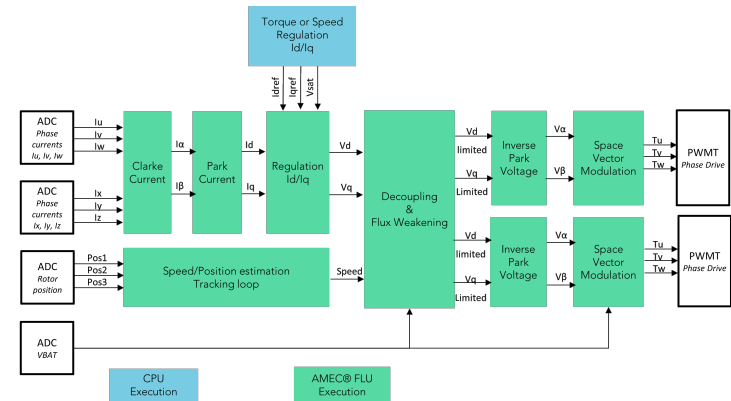

DC-DC Converter Control

On Board Charger Control

# OLEA® LIB System Features

## Inverter Control

Complete inverter control for PMSM or WRSM motors based on field oriented control and space vector modulation algorithms.

All system functions include:

- MATLAB / Simulink reference model
- MATLAB / Simuling target model ready for code generation

## DC-DC Converter Control

Buck-Boost Valley Current control function supporting up to 6 DC-DC converters in parallel.

- Configurable parameters via GUI
- Diagnostic functions

# OLEA® LIB Algorithm Features

- Speed regulation with D/Q-Axis control PI regulators with Anti Wind-up.
- DQ-axis Reference current computation
- Torque control with D/Q-Axis reference current computation
- Clarke Current: 3 to 2 phases or 6 to 2 phases current transformation
- Park Current: 2 phases current rotation from  $\alpha\beta$  to DQ framework
- Inverse Park Voltage: DQ framework reference voltage transform into  $\alpha\beta$  voltage space vector
- DQ-axis Decoupling and flux weakening
- IDQ regulation from torque set point
- Space Vector Modulation
- Position and speed estimation based on Tracking-loop algorithm
- Position and speed estimation: for standstill, low-speed and high-speed operating modes
- Buck-Boost valley current control
- Voltage control

# OLEA® LIB Math Features

Operator	Description	Exec. Cycles	# of Operators*
CORDIC (COrdinate Rotation Digital Computer)	<ul style="list-style-type: none"><li>• <math>x \cdot \cos(\theta) - y \cdot \sin(\theta)</math></li><li>• <math>y \cdot \cos(\theta) + x \cdot \sin(\theta)</math></li><li>• <math>\operatorname{atan}\left(\frac{y}{x}\right)</math></li><li>• <math>\sqrt{x^2 + y^2}</math></li></ul> <ul style="list-style-type: none"><li>• <math>x \cdot \cosh(\theta) - y \sinh(\theta)</math></li><li>• <math>y \cdot \cosh(\theta) + x \sinh(\theta)</math></li><li>• <math>\operatorname{atanh}\left(\frac{y}{x}\right)</math> with <math>\frac{y}{x} \in [-0,8; 0,8]</math></li><li>• <math>\sqrt{x^2 - y^2}</math> with <math>\frac{y}{x} \in [-0,8; 0,8]</math></li></ul>	Resolution in bit + 4	• 6 in parallel
Division	$A/B = \text{Quotient with remainder}$	26	• 3 in parallel
Square root	<ul style="list-style-type: none"><li>• <math>\sqrt{R}</math> in unsigned mode</li><li>• <math>\sqrt{ R }</math> in signed mode</li></ul>	2	• 3 in parallel
Matrix Multiplier	<ul style="list-style-type: none"><li>• <math>\begin{bmatrix} r_0 \\ r_1 \end{bmatrix} = \begin{bmatrix} a_0 &amp; a_1 &amp; a_2 &amp; a_3 &amp; a_4 &amp; a_5 \\ a_6 &amp; a_7 &amp; a_8 &amp; a_9 &amp; a_{10} &amp; a_{11} \end{bmatrix} \times \begin{bmatrix} b_0 \\ b_1 \\ b_2 \\ b_3 \\ b_4 \\ b_5 \end{bmatrix}</math></li><li>• <math>r_0 = \sum_{i=0}^{\text{iter}} (a_i \times b_i \gg Q_f)</math></li><li>• <math>r_1 = \sum_{i=0}^{\text{iter}} (a_{i+6} \times b_i \gg Q_f)</math></li></ul>	Iter + 4	• 3 in parallel
PID (Proportional Integral Derivative controller)	Saturation with Anti-windup: <ul style="list-style-type: none"><li>▪ Back calculation : if saturation then <math>\text{integral}_n = K_i \times e_n - K_b (\text{pid}_{n-1} - \text{pid\_sat}_{n-1}) + \text{integral}_{n-1}</math></li><li>▪ Integral clamping : if saturation and <math>\text{sign}(\text{pid}_{n-1}) = \text{sign}(e_{n-1})</math> then <math>\text{integral}_n = \text{integral}_{n-1}</math></li></ul>	8	• 6 in parallel
